

Sequential Batch Reactors

SBR Technology

With this technology most wastewaters can now be treated biologically in ideal conditions, regardless of flow or load variations. Phosphorous and nitrates can be removed biologically, as well.

- Achieves nitrification, denitrification, and phosphorous removal (without chemical addition) in a single reactor
- Designed to consistently meet effluent discharge requirements
- Provides the ability to change any unit process at any time - to achieve a required effect
- Minimal operational and maintenance costs
